**ETHIOPIA
SIXTH HEALTH ACCOUNTS,
2013/14:
STATISTICAL REPORT**

Addis Ababa, August 2017

Recommended Citation: Federal Democratic Republic of Ethiopia Ministry of Health. August 2017. *The Ethiopia Sixth Health Accounts, 2013/14: Statistical Report*. Addis Ababa, Ethiopia.

Program management and technical support for this round health accounts exercise including printing of this report was provided by the United States Agency for International Development (USAID) through Health Sector Financing Reform/Health Finance & Governance (HSFR/HFG) Project which is part of the USAID's global Health Finance & Governance Project (HFG) implemented by Abt Associates Inc. under cooperative agreement -AID-OAA-A-12-00080. Funding for data collection, analysis, writing and printing of this report was provided by the Bill and Melinda Gates Foundation through the Immunization Financing Project and this project too is being implemented by Abt Associates Inc.

Additional information about the *Ethiopia Sixth Health Accounts, 2013/14: Statistical Report* may be obtained from the Federal Democratic Republic of Ethiopia Ministry of Health, Resource Mobilization Directorate, Lideta Sub City, Addis Ababa, Ethiopia. ACKNOWLEDGMENTS

The FDRE Ministry of Health would like to extend its appreciation to all those who have been involved in the data collection and analysis for the sixth round Health Accounts (HA) as well as the writing and production of this report. This round of HA involved a wide range of institutions and individuals whose efforts the Ministry appreciates profoundly: the Ministries of Finance and Economic Cooperation and of Defense, the Federal Prison Administration, universities, donors, nongovernmental organizations, private and public enterprises, insurance companies, households and people living with HIV who responded to the surveys and shared relevant information. The Ministry of Health also thanks the Ethiopian Revenues and Customs Authority, Ministry of Public Enterprises, and the Charities and Societies Agency for providing lists of private sector enterprises, public (parastatal) enterprises, and local and international NGOs, respectively.

The Ministry of Health acknowledges the financial support of the United States Agency for International Development (USAID), and the Bill and Melinda Gates Foundation. The ministry is extremely thankful for the technical and quality assurance support provided by USAID Health Sector Financing Reform/Health Finance and Governance (HSFR/HFG) in all aspects of this study as well as in the institutionalization process of the HA exercise. The ministry also thanks World Health Organization (WHO) and United Nations Children’s Fund (UNICEF) for assigning technical persons starting from planning up to finalization of the study.

The Ministry of Health congratulates the members of the multi-disciplinary HA technical working group, who carried out the data collection and analysis and production of this report. The team members include Dr. Mizan Kiros, Eyerusalem Animut, Mideksa Adugna Ermias Dessie and Belay Aurgessa from the ministry; Leulseged Ageze, Hailu Nega Zelelew, Tesfaye Dereje, Habtamu Tadesse, and Yenehun Tawye from Abt Associates; Amsalu Shiferaw and Martha Kibur from UNICEF; and Dr. Sofonias Getachew from WHO.

Finally, the Ministry of Health appreciates the contributions of reviewers from the Health Financing Technical Working Group. Professional review and editing by Linda Moll was critical in giving the document its final shape, and contributed greatly to its readability.

I. PURPOSE OF THE METHODOLOGICAL NOTE

This methodological note provides an overview of the System of Health Accounts (SHA) 2011 framework used for Ethiopia's sixth Health Accounts (HA VI) estimation. The background section describes the HA process in general; following sections discuss Ethiopia's HA VI, and the annexes contain the HA VI statistical tables. In this way, the note is a record of HA VI data collection approaches and results, analytical steps taken, assumptions made, and findings reached. The information is intended for stakeholders/researchers who want to know more about the methodology employed, in addition to the results presented in the health accounts report (FMOH 2017).

2. BACKGROUND

2.1 Overview of Health Accounts Methodology

In a rapidly changing health care environment, policymakers need reliable national information on the sources and use of funds for health to enhance health system performance. HA estimations provide such information. HA is an internationally recognized methodology used to track expenditures in a health system for a specified period of time. The methodology is based on the SHA established by the Organization for Economic Cooperation and Development (OECD) to regularly track health expenditure of its high-income member countries (OECD 2000). Having first helped low- and middle-income countries to do HA studies in the 1990s, in 2003 the World Bank, World Health Organization (WHO), and U.S. Agency for International Development (USAID) published the “Producers’ Guide” to assist these countries to measure their national health expenditures and resource flows (World Bank et al. 2003). In 2011, SHA 1.0 was revised to help countries use similar standard methods regardless of their level of economic development and income. SHA 2011 is now the international standard for national-level HA estimations. To streamline the HA data management and analysis, the USAID Health Finance and Governance project in collaboration with WHO developed the Health Accounts Production Tool (HAPT) (Ashagari et al. 2014).

The HA is a powerful and useful framework for estimating health expenditure of a country and tracking the flow of these resources through the health system from financing sources to actual health services and commodities. In addition to providing a single-year snapshot of health expenditures, over the long term, a country can institutionalize the HA process and produce a time series of standardized tables, permitting a more thorough assessment of the progress it is making toward its health system goals. In the HA framework, health expenditures are defined as “all expenditures for activities whose primary purpose is to restore, improve and maintain health for the nation and for individuals during a defined period of time” (WHO et al. 2003).

HA follows the flow of funding for health from its origins to end use, answering questions such as: How are health care goods and services financed? Where are health care goods and services consumed by the population? What goods and services are financed? By breaking down health spending by different classifications, HA provide insight into issues such as whether resources are being allocated to national priorities, the sustainability of health financing, and the extent to which there is financial risk protection for households. It provides sound evidence for decision making and is a useful tool in informing health financing reforms.

The SHA 2011 methodology was used to complete this round of Ethiopia’s HA estimation.

2.2 Key Health Accounts Concepts: Boundaries, Dimensions, and Indicators

2.2.1 Boundary Definitions

The boundaries presented below are standard to the SHA 2011 framework.

- **Health Boundary:** The boundary of “health” in the HA is “functional”¹ in that it refers to activities whose primary purpose is disease prevention, health promotion, treatment, rehabilitation, and long-term care. This boundary includes services provided directly to individual persons and collective health care services covering traditional tasks of public health.

In the SHA 2011 framework, health care-related and capital formation spending is tracked separately. Health care-related activities are intended to improve the health status of the population, but their *primary purpose* lies elsewhere. Examples of health care-related activities are food, hygiene, and drinking water control, and the social component of long-term care for the elderly. Capital formation refers to health care investments that last more than one year, such as infrastructure and equipment, as well as education and training of health personnel, and research and development in health. Capital formation contrasts with “current health expenditure,” which is completely consumed within the annual period of analysis.

- **Time Boundary:** The HA time boundary specifies a one-year period and includes the value of the goods and services that were consumed during that period. HA uses accrual accounting, by which expenditures are classified in the year in which they create economic value rather than when they are transacted.
- **Space Boundary:** HA “focuses on the consumption of health care goods and services of the resident population irrespective of where this takes place” (OECD et al. 2011). Goods and services consumed by a country’s residents are included, even if they are abroad, while consumption by non-residents in Ethiopia is excluded from the HA estimation.
- **Disease Boundary²:** The SHA 2011 methodology focuses on the spending on priority diseases (as specified under ICD 10) whose primary purpose is prevention, health promotion, treatment, rehabilitation, and long-term care.
- **Curative Care Boundary:** Curative care starts with the onset of disease and encompasses health care during which the “principal intent is to relieve symptoms of illness or injury, to reduce the severity of an illness or injury, or to protect against exacerbation and/or complication of an illness and/or injury that could threaten life or normal function” (OECD et al. 2011). It includes inpatient, outpatient, home-based, and day curative care.³
- **Inpatient Care Boundary:** Inpatient care involves a formal admission to a health care facility that involves an overnight stay after admission.
- **Outpatient Care Boundary:** Outpatient care is delivered from the health care providers’ premises but does not involve a formal admission to a health care facility.

¹ Services that fall outside of the functional definition of health are not counted.

² This boundary of disease spending does not include spending on other activities related to the priority disease responses such as care for orphans and vulnerable children, enabling environment programs, and social protection and social services.

³ Across each of these types, it also includes general and specialized curative care.

- **Prevention Boundary:** Prevention interventions start with an individual in a healthy condition. The aim is to enhance health status and to maintain a condition of low risk of disease, disorder, or injury. Preventive interventions also cover individuals at specific risk and those who have either no symptoms of the disease or early signs or symptoms, where early case detection will help reduce the potential damage by enabling a more successful intervention (OECD et al. 2011).⁴ (OECD et al. 2011).

2.2.2 Classifications

The HA exercise involves analyzing data on health expenditure according to a set of classifications, as defined under the SHA 2011.⁵

- **Financing Schemes (HF):** The main funding mechanisms by which people obtain health services. Financing schemes categorizes spending according to criteria such as: mode of participation in the scheme (compulsory vs voluntary), the basis for entitlements (contributory vs non-contributory), the method for fundraising (taxes/compulsory pre-payments vs voluntary payments) and the extent of risk pooling.
- **Revenue of Financing Schemes (FS):** The types of transactions through which funding schemes mobilize their income. Examples are transfers from a ministry of finance to governmental agencies, direct foreign financial transfers (e.g., external donors providing funds to NGOs), and voluntary prepayment from employers.
- **Financing Agents (FA):** These are institutional units that manage health financing schemes. These often include the country's ministry of health, insurance companies, NGOs, households and international organizations.
- **Health Care Providers (HP):** Organizations and actors who provide medical goods and services as their main activity, such as hospitals, health centers, clinics, and pharmacies.
- **Health Care Functions (HC):** Goods and services consumed by end-users. These include curative care; information, education, and counseling programs; medical goods/pharmaceuticals; and governance and health system administration.
- **Factors of Provision (FP):** Inputs to the production of health care goods and services by health care providers, such as compensation of employees, health care goods and services, and non-health care goods and services.
- **Beneficiary Characteristics:** Groups that consume, or benefit from, the health care goods and services. Beneficiaries can be grouped in several ways such as disease, gender, and age classifications.

⁴ Examples are breast and prostate cancer, where age and sex affect the risk of getting the disease, and lung cancer, where certain lifestyle choices such as smoking increase the risk.

⁵ For additional details on the SHA 2011, please refer to the SHA 2011 Brief (Cogswell et al. 2013) or the SHA 2011 manual.

2.2.3 Aggregates and Indicators

The aggregates defined below are among those estimated as part of this HA.

- **Total Current Health Expenditure (CHE):** CHE quantifies the economic resources spent on health functions and represents final consumption on health goods and services by residents of the country within the year of estimation.
- **Gross Capital Formation:** Gross capital formation on health is measured as the total value of assets that providers have acquired during the estimation year and that are used for longer than one year in the provision of health services.
- **Total Health Expenditure (THE):** The sum of CHE and gross capital formation.
- **National Health Expenditure (NHE):** The sum of CHE, gross capital formation, and health care-related spending.
- **Total Current Health Expenditure as Percentage of Gross Domestic Product (GDP).⁶**
- **Total Current Health Expenditure per Capita (CHE per capita):** CHE divided by the population.⁷

⁶ The GDP estimation figure for 2013/14 was obtained from the Annual Report of the National Bank of Ethiopia.

⁷ The estimation of population for the study period 2013/14 was taken from the Population and Housing Census 2007 (CSA and MOFED 2007).

3. OVERVIEW OF ETHIOPIA'S HA VI

3.1 Objective

The purpose of the HA IV exercise was to estimate the amount and flow of health spending in the Ethiopian health system in 2013/14. In addition to estimating general health expenditures, the exercise tracked spending on the different disease categories and priority areas. It also assessed household out-of-pocket spending, the sustainability of financing in light of decreasing donor funding, levels of risk pooling and contributions by the private sector, beneficiaries of health services, etc. For more information on the policy questions driving the estimation as well as findings and their policy implications, please see the main HA VI report (FMOH 2017).

3.2 Process

The HA IV was conducted between October 2015 and November 2016. Following the launch workshop in October 2015, the Sixth Health Accounts Technical Working Group (HA VI TWG), with representation from the Federal Ministry of Health (FMOH), the USAID-funded Health Sector Financing Reform (HSFR)/Health Finance and Governance (HFG) project led by Abt Associates, the WHO, and the United Nations Children's Fund (UNICEF) began primary and secondary data collection. The HA VI TWG then compiled, cleaned, triangulated, and reviewed the data: data were imported into the Health Accounts Production Tool (HAPT) and mapped to each of the SHA 2011 classifications. The results of the analysis were validated with FMOH management at various stages of the analysis.

4. DATA SOURCES

4.1 Primary institutional data sources

The HA TWG used an institutional survey to collect primary data collection from donors, NGOs, employers, and insurance companies. These sources were identified from the records of previous National Health Accounts (NHA)⁸ surveys and further brainstormed during the HA training for the current round. Audited government health expenditure data came from the Federal Ministry of Finance and Economic Cooperation (MOFEC), disaggregated at various levels of government and by budgetary institutions and providers.

The HA TWG provided each institution standard HA survey instrument to collect the required health spending information. The list below describes each group surveyed. Table 1, which follows the list, summarizes the response rate of organizations sampled.

- **Donors (bilateral and multilateral):** All bilateral and multilateral donors that supported the Ethiopian health sector at all levels were given a survey. A total of 39 donors were included. Only the International Organization for Migration (IOM) refused to complete the questionnaire.
- **NGOs (international and local):** An exhaustive list of NGOs working in the health sector was compiled based on lists obtained from the Charities and Societies Agency. A list of NGOs that are members of CCRDA, an umbrella organization of most NGOs in country, was obtained to support the data from the Charities and Societies Agency. A total of 265 NGOs (129 international and 136 local) were considered for the HA VI exercise. The TWG made an effort to survey all the international NGOs. It also randomly selected 136 local NGOs from the total of 550 identified as active in the Ethiopian health sector; 107 of the 136 filled in and returned the questionnaires (29 did not).
- **Employers (parastatals and privates):** The universe of entities was obtained from two institutions: the Ministry of Public Enterprises⁹ for parastatals and the Ethiopian Revenues and Customs Authority for private employers. After applying different criteria to systematically categorize the employer organizations list, the total sample frame considered was 10,380 employers (33 parastatals and 10,347 private employers). In determining the final sample size, institutions were first grouped into the four major economic sectors, namely, agriculture, manufacturing, mining, and services. Using the World Trade Organization's classification of the services sector, this sector was further disaggregated into nine subsectors. All organizations that employed 10 or more people were considered for the sample frame. A final total sample size of 345 (312 randomly selected private employer institutions and 33¹⁰ parastatals (taken as census)) were covered in the survey. Of the 345, 331 (96 percent) filled in and returned the completed questionnaires. All the 33 parastatals, including the five big entities (Ethiopian Air Lines, Ethio-telecom, Ethiopian Electric Power Corporation, Commercial Bank of Ethiopia, and Metal and Engineering Corporation) filled in and returned the questionnaire.
- **Insurance companies:** All the 17 insurance companies (16 private and one public) that were operational during the study period were covered. All provided the requested information.

⁸ The HA exercise was originally called "National Health Accounts."

⁹ The then Privatization and Public Enterprises Supervising Agency (PPESA).

¹⁰ Twenty-seven enterprises are under PPESA, while six are not.

- Government expenditures:** The MOFEC provided audited government health expenditure data. The data cover government spending in the health sector from all government sources (federal, regional, city, and woreda) and by providers. The data were reorganized into the HA categories and classifications from sources to functions. They showed that resources for the health sector come from the Treasury as well as from foreign sources (bilateral and multilateral donors) as assistance and loans. Sources of funding for government spending from both the Treasury and loans were considered as government. Health-specific assistance funding was considered as “rest of the world.” The health expenditure data from line ministries/agencies (i.e., Ministries of Women and Children’s Affairs, of Labor and Social Affairs, of Communication and Information Technology, and of Construction, as well as the Pharmaceutical Fund and Supply Agency (PFSA) and 26 universities with health science faculties/colleges that are not captured in the MOFEC data were separately surveyed.

Table 1: Response Rate of Institutions Sampled for Ethiopia’s HA IV

Target Group	Number of Organizations Targeted	Number of Respondents	Response Rate (%)	Remarks
Donors	39	38	97	
NGOs	265	236	89	
Employers	345	331	96	
Insurances	17	17	100	
Universities	28	26	93	
Line Ministries/Agencies	10	5	50	Data obtained only from 4

4.2 Primary Health Expenditure Survey of Households

As in the previous two HA rounds (IV and V), HA IV conducted a household survey to estimate household out-of-pocket spending in Ethiopia. The survey covered 10,000 households to track their expenditure on general health and other disease categories/priority areas. This survey was subcontracted to Breakthrough International Consultancy (BIC) Plc. The Ethiopia Public Health Institute, FMOH, HSFR/HFG, UNICEF, and WHO provided technical support to the consulting firm on sampling, sample selection, survey instruments, data capture, and data analysis. The scope of the survey went beyond HA, as it covered household health services utilization as well as health expenditures. A separate, comprehensive “Household Health Services Utilization and Health Expenditure Survey Report” will be published by the FMOH (forthcoming 2017). For more detail on the scope of the household survey please refer to the separate household survey report.

4.3 The PLHIV Survey

In light of the sensitivity and ethical considerations associated with data collection on HIV and AIDS, a separate, targeted survey was conducted to track the health expenditures of these segments of society in Ethiopia. The survey sampled 4,200 people living with HIV (PLHIV) from all nine regions and two city administrations in the country. The PLHIV survey was conducted by BDS Center for Development Research (BDS-CDR), a local consultancy firm working in the area.

4.4 Secondary Data Sources

The HA IV TWG also gathered secondary data. The data focused on health services utilization and unit cost of providing services. The health services utilization and the unit cost data gathered from the FMOH were used to develop/generate distribution keys. The distribution keys were in turn used to break down or split spending aggregates into the different health functions and diseases categories at the various health provision levels, as required in the SHA 2011 framework. Other secondary data sources gathered for this current round of Ethiopia's HA include: Annual Reports and research publications of the FMOH, Population and Housing Census 2007 of the Central Statistical Agency, Macroeconomic Reports of the MOFEC (for GDP estimates), and Annual Reports of the National Bank of Ethiopia (for the exchange rates).

5. DATA ANALYSIS

5.1 Weighting

The HA exercise uses weights to extrapolate the THE of the sampled institutions to the THE of the total population considered as the sample frame of the survey. In HA VI, the TWG applied weights to the employers and local NGOs whose health expenditure data were collected through sampling. The extrapolation both for employers and local NGOs was done on the stratified sample frame constructed based on different sectors/subsectors. The TWG did not apply any weights for those institutions whose data were collected through the census, such as donors, international NGOs, and insurance companies.

5.2 Double counting

The HA exercise requires careful compilation of data from various sources, and identification and management of instances in which two data sources report the same spending. For instance, spending on donor-funded health programs administered by NGOs was reported both in donor surveys and NGO surveys. In such situations, the TWG used the spending reported by the NGOs rather than by the donors – HA practice is to use the data of entities/agents closer to the actual consumption of health care services, because they are likely to have more precise information about the expenditure than those farther removed.

Double counting can also exist between NGOs, if one NGO pays another NGO to implement a health program/provide a service. In situations like this, the data of the NGO closest to the spending, i.e., the NGO that received the payment to provide the health good or service, is included in the analysis. Still other double counting exists at the employer-insurance company level, since the health insurance premium payment reported by employers as spending is also reported as revenue by the insurance companies. Similar to the NGO-NGO example, the data of the institution closest to the spending, in this case the insurance company, were used for the analysis, and the data from the employer were excluded.

In doing the HA VI, the TWG identified the following cases of double counting:

- Donor vs NGO,
- NGO vs NGO,
- Donor vs Donor,
- MDG PF vs Donor,
- Gov't vs Donor,
- Employer vs Insurance,

The TWG took care of the issues by applying the general principle described above. Excluding the affected expenditure data from donors, NGOs, employers, etc. during double-counting checks does not diminish the importance of collecting the spending information as a useful source of data triangulation.

5.3 Estimation and application of distribution keys

While doing the exercise, the HA TWG realized that health spending as reported in secondary sources or in surveys required additional breakdowns in order to allocate the reported spending figures into the various classifications of the SHA 2011 framework. Hence, the HA exercise involved estimating “distribution keys” to split the spending by providers, functions, and disease classifications. The TWG followed the following steps to calculate the distribution keys:

Step 1: Compiled utilization and costing data

The TWG obtained health services utilization data from the FMOH Health Management Information System (HMIS) database. The costing information came mainly from the “Cost of Primary Care Facilities, Departments, and Exempted Services in Ethiopia” draft report, (Fenot Project 2015). Preliminary findings from the unit cost study of Jimma and Wolayita Sodo Hospitals, obtained from the FMOH, were also used for the estimation. Finally, costing figures from the Health Sector Transformation Plan were used for some health services that were not included in the two unit cost studies mentioned above.

Step 2: Calculated the price x quantity

These total cost figures were derived by multiplying unit costs by visits for outpatient services, and unit costs by bed days for inpatient admissions for all the health services provided both at the health center and hospital levels. Put differently, the total cost of health services provided for the different disease classifications at the two health facility levels was calculated using the price information taken from the unit cost studies and the quantity of services determined in step 1.

Step 3: Calculated the breakdown of health spending on health care functions

The information calculated in step 2 was then summarized according to the functional classifications at the different levels of care by adding the total cost per functional classification category. The functional classifications included outpatient, inpatient, prevention (including maternal health, HIV, and family planning), and different immunization programs. The proportional share of the total costs by level of service provision was calculated for each functional classification category. The formula used is as follows: the average cost of inpatient care multiplied by the total number of inpatient episodes at health facilities, divided by the average cost of inpatient and outpatient care multiplied by total episodes of care at health facilities.

Step 4: Calculated disease distribution for health centers and hospitals

At the health center and hospital levels, the disease distribution was calculated for inpatient and outpatient services by calculating the proportional share of costs of each disease category of the total costs incurred for inpatient and outpatient services at these levels of service provision.

Step 5: Calculated spending distribution by age

Age distribution was calculated based on information on utilization of services in both outpatient and inpatient departments at the different levels of facilities by age category as derived from the utilization database and unit cost figures.

Step 6: Imported distribution keys into HAPT

The final step in the development of distribution keys is to import all the distribution key estimates into the HAPT.

6. USE OF THE HAPT

Throughout the HA process, the TWG used the HAPT, which as noted above is a tool that facilitates HA planning and production. The HAPT automates several previously time-consuming procedures like repeat mapping, and incorporates automatic quality checks. It also provides a repository for HA data and HA tables, so they can be easily accessed by HA team members years after an HA exercise is done. In addition, distribution keys and mapping decisions from previous years can be used to facilitate data analysis in subsequent years. In using the HAPT, a list of all institutions to be surveyed was entered into the tool. All data collected were imported into the HAPT and mapped to the SHA 2011 classifications. The TWG used all six modules¹¹ of the HAPT in entering general information and data, customizing codes, mapping, checking for double counting, applying rules, validating the data, and so forth, through the generation of HA graphs, tables, and reports.

¹¹ The six modules are: Home, Customization, Data Sources, Data Import, Mapping, and Validation.

7. COMPARING METHODOLOGY OF HA V AND VI

Table 2 juxtaposes methods used to collect and analyze data in rounds V (2010/11) and VI (2013/14) of the HA exercise in Ethiopia.

Table 2. Comparison of NHA V (2010/11) and VI (2013/14) Exercises

Data Collection	2010/11	2013/14
Government	Captured health spending for all levels of government (federal, regional, woreda) by budgetary institutions and by providers from MOFED.	Similarly captured spending from MOFEC, but also collected data directly from 4 line ministries and 26 universities.
Donor	Surveyed and captured data from all donors operating in the health sector of the country.	Similar.
NGO	Surveyed and captured data from all NGOs (international and local) working in the health sector as census.	Similar for international NGO, but surveyed local NGOs based on samples.
Insurance	Surveyed all insurance companies operating in Ethiopia.	Similar.
Employer	Surveyed a sample of 290 employers, after stratifying them in different economic sectors. The threshold level applied was the turnover or sales of the enterprises, and it differed across economic sectors/subsectors.	Similarly surveyed 345 employers but the threshold level for inclusion in the sample frame was employing 10 or more people for all economic sectors.
Household	A general household survey covering 10,060 households was conducted to capture the health spending of Ethiopian households.	Similar. A few questions were added to capture community contributions.
PLHIV	A targeted survey covering 4,000 PLHIV was conducted to capture the health spending of this population segment.	Similar. A survey of 4,200 PLHIV was conducted but the expenditure data not yet used.
Mapping	The health expenditure data collected from various sources was mapped by Financing Sources, Financing Agents, Health Care Providers, and Health Care Functions, based on the SHA 1.0 framework.	The SHA 2011 framework, which added classifications such as Revenues of Financing Schemes, Financing Schemes, Diseases, Age, and Factors of Provision (inputs), was used.
Double counting	Double counting was removed between: <ul style="list-style-type: none"> • NGOs and donors • Individual NGOs • Individual donors • Donors and government • Employers and insurers 	Similar.

Data Collection	2010/11	2013/14
Split Rules	2010/11	2013/14
Disease distribution	Split rules for subaccounts were calculated as the proportional share of the total costs incurred based on utilization and unit cost data.	HA VI provides a full disease breakdown. It used utilization and unit cost studies to split expenditures into the different diseases categories.
Inpatient/ Outpatient splits	Outpatient and inpatient ratios were derived from services utilization rates at health facilities and estimated costs of these services as determined by unit cost studies.	Similar.
Age split		Age splits are calculated based on the proportion of OP visits/IP bed days for < 5, >5 patients broken by health facilities (health center and hospital).

Note: OP=outpatient, IP=inpatient. Round V (and earlier rounds) of HA were called National Health Accounts (NHA). The MOFEC was previously called the Ministry of Finance and Economic Development (MOFED).

ANNEXES

The statistical tables provided in this section summarize the HA data through a series of two dimensional tables. Each table cross-tabulates spending for two HA classifications. The eight annexes (A–H) comprise 63 statistical tables. Twenty-one of the tables show data from the General Health Accounts. Annexes B–H contain tables on disease conditions/categories, such as HIV, TB, malaria, reproductive health, nutritional deficiency, non-communicable disease, and injury; each category has six tables. As specified under the titles of the various statistical tables, both recurrent and capital expenditure accounts are presented as appropriate.

ANNEX A: GENERAL HEALTH ACCOUNTS STATISTICAL TABLES
